4. Clustering countries based on early Covid-19 spreading data
5. Improving further the results from the perspective of clustering

# Outline

## 1. Motivations

## 2. Overview of Clustering Techniques

## 3. Dimensionality Reduction

## 4. Clustering countries based on early Covid-19 spreading data

## 5. Improving further the results from the perspective of clustering

# Real Objective

## Predicting future contaminations for a certain region

## Why?

- ▶ Help local health authorities to manage hospital beds.
- ▶ Help local politics to take appropriate actions to protect population.

# Data driven approaches

## Train a Machine Learning model on previous data

## Advantages?

- ▶ No need to estimate contamination parameters (Difficult).
- ▶ Get better as we get more data.

# Difficulty with Learning to Predict Contamination

Few data and different response form

## Sources of differences between countries/regions

- ▶ Policy to prevent spread of the disease (border closing, lockdown)
- ▶ Testing policy (Percentage of population, already sick people only)
- ▶ reporting of results (seasonality)

# Solution?

Identify countries with similar responses in advance

⇒ **Clustering countries before learning**

# Outline

1. Motivations
- 2. Overview of Clustering Techniques**
3. Dimensionality Reduction
4. Clustering countries based on early Covid-19 spreading data
5. Improving further the results from the perspective of clustering

# Problem definition

## Grouping point in an unsupervised manner

- ▶ High intra-cluster similarity
- ▶ Low between-cluster similarity

# Taxonomy of Clustering Algorithms

## Partitioning-based

- ▶ K-means, Fuzzy C-means, DEC, ...
- ▶ Easy integration of new points

## Connectivity-based

- ▶ Hierarchical, Affinity Propagation, JULE, ...
- ▶ Only requires distances between data points

# K-means clustering

Formulation for  $M$  data points and  $K$  desired clusters.

$$\begin{aligned} &\underset{A, c}{\text{Minimize}} && \sum_{i=1}^M \sum_{k=1}^K a_{ik} \times d(x_i, c_k), \\ &\text{subject to} && \sum_{k=1}^K a_{ik} = 1, \forall i \in \{1, \dots, M\}, \\ &&& a_{ik} \in \{0, 1\}, \forall i, \forall k. \end{aligned}$$

With

- ▶  $c_k$  cluster centers,
- ▶  $a_{ik}$  membership binary variables,
- ▶  $d(., .)$  distance metric used.

# K-means resolution using Alternating Optimization

Initial data

# K-means resolution using Alternating Optimization

Centroids initialization

# K-means resolution using Alternating Optimization

Classes actualization

$$x_i \in C_l \iff d(x_i, c_l) \leq d(x_i, c_k), \forall k \in \{1, \dots, K\}.$$

# K-means resolution using Alternating Optimization

Centroids update

$$c_k = \frac{1}{\sum_{i=1}^M a_{ik}} \sum_{i=1}^M a_{ik} \times x_i$$

# K-means resolution using Alternating Optimization

Classes actualization

# K-means resolution using Alternating Optimization

Centroids update

# Number of clusters?

KMeans

$K = 2$

$K = 3$

$K = 4$

Affinity Propagation

Damping = 0.5

Damping = 0.8

# Affinity Propagation

No need to know number of clusters

Responsibility

	A	B	C	D
A	-2.8	-0.7	-2.8	2.8
B	-0.9	-3.0	-2.3	3.0
C	-2.0	-1.3	-2.0	2.0
D	-4.9	-4.7	-5.7	0.0

Availability

	A	B	C	D
A	0.0	-3.0	-2.0	0.0
B	-2.8	0.0	-2.0	0.0
C	-2.0	-3.0	0.0	0.0
D	-2.8	-3.0	-2.0	7.7

## Example of Affinity Propagation

Participant	Tax Rate	Fee	Interest Rate	Quantity Limit	Price Limit
Alice	3	4	3	2	1
Bob	4	3	5	1	1
Cary	3	5	3	3	3
Doug	2	1	3	3	2
Edna	1	1	3	2	3

Participant	Alice	Bob	Cary	Doug	Edna
Alice	-22	-7	-6	-12	-17
Bob	-7	-22	-17	-17	-22
Cary	-6	-17	-22	-18	-21
Doug	-12	-17	-18	-22	-3
Edna	-17	-22	-21	-3	-22

# Compute Responsibility

$$r(i, k) \leftarrow s(i, k) - \max_{k' \text{ such that } k' \neq k} \{a(i, k') + s(i, k')\}$$

Participant	Alice	Bob	Cary	Doug	Edna
Alice	-22	-7	-6	-12	-17
Bob	-7	-22	-17	-17	-22
Cary	-6	-17	-22	-18	-21
Doug	-12	-17	-18	-22	-3
Edna	-17	-22	-21	-3	-22

Participant	Alice	Bob	Cary	Doug	Edna
Alice	-16	-1	1	-6	-11
Bob	10	-15	-10	-10	-15
Cary	11	-11	-16	-12	-15
Doug	-9	-14	-15	-19	9
Edna	-14	-19	-18	14	-19

# Compute Availability

$$a(i, k) \leftarrow \min \left\{ 0, r(k, k) + \sum_{i' \text{ such that } i' \notin \{i, k\}} \max\{0, r(i', k)\} \right\}$$

Participant	Alice	Bob	Cary	Doug	Edna
Alice	-16	-1	1	-6	-11
Bob	10	-15	-10	-10	-15
Cary	11	-11	-16	-12	-15
Doug	-9	-14	-15	-19	9
Edna	-14	-19	-18	14	-19

Participant	Alice	Bob	Cary	Doug	Edna
Alice	21	-15	-16	-5	-10
Bob	-5	0	-15	-5	-10
Cary	-6	-15	1	-5	-10
Doug	0	-15	-15	14	-19
Edna	0	-15	-15	-19	9

## Compute Availability diagonal

$$a(k, k) \leftarrow \sum_{i' \text{ such that } i' \neq k} \max\{0, r(i', k)\},$$

Participant	Alice	Bob	Cary	Doug	Edna
Alice	-16	-1	1	-6	-11
Bob	10	-15	-10	-10	-15
Cary	11	-11	-16	-12	-15
Doug	-9	-14	-15	-19	9
Edna	-14	-19	-18	14	-19

Participant	Alice	Bob	Cary	Doug	Edna
Alice	21	-15	-16	-5	-10
Bob	-5	0	-15	-5	-10
Cary	-6	-15	1	-5	-10
Doug	0	-15	-15	14	-19
Edna	0	-15	-15	-19	9

# Cluster assignment

Criterion Matrix:  $C = R + A$

Participant	Alice	Bob	Cary	Doug	Edna
Alice	<b>5</b>	-16	-15	-11	-21
Bob	<b>5</b>	-15	-25	-15	-25
Cary	<b>5</b>	-26	-15	-17	-25
Doug	-9	-29	-30	<b>-5</b>	-10
Edna	-14	-34	-33	<b>-5</b>	-10

- ▶ Cluster 1: Alice, Bob, Cary
- ▶ Cluster 2: Doug, Edna

# Clustering Evaluation Metrics

## Intrinsic measures

- ▶ The ground truth labels are not known
- ▶ Example: Silhouette Coefficient

$$s = \frac{b-a}{\max(a,b)}$$

**a** mean distance between sample & other points in the class.

**b** mean distance between sample & nearest cluster.

**silhouette** mean of **s** across all points.

# Clustering Evaluation Metrics

## Extrinsic measures

- ▶ The ground truth labels are available
- ▶ No label correspondence  $[0\ 0\ 0\ 1\ 1\ 1\ 2\ 2\ 2]$  vs  $[1\ 1\ 1\ 0\ 0\ 0\ 2\ 2\ 2]$
- ▶ Example: Clustering Accuracy

$$ACC(Y, C) = \max_{perm \in P} \frac{1}{N} \sum_{i=0}^{n-1} 1 (perm(C_i) = Y_i)$$

# Outline

1. Motivations
2. Overview of Clustering Techniques
- 3. Dimensionality Reduction**
4. Clustering countries based on early Covid-19 spreading data
5. Improving further the results from the perspective of clustering

# What is dimensionality reduction?

Original data in high dimension  $N \rightarrow$  find an embedding of smaller dimension  $M$  which still represents the initial data.

## Usage?

- ▶ Data visualization
- ▶ Data exploration
- ▶ Extract underlying concepts
- ▶ Speed up learning algorithms
- ▶ Scale data to algorithm
- ▶ Data compression

# How to achieve DR?

```

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2
3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3
4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4
5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5
6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6
7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7
8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8
9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9

```

$$N = 28 \times 28 = 784$$

$$M = 2$$

## How to go from 784 feature dimensions to 2 while keeping important information?

- ▶ Feature elimination
- ▶ Feature selection
- ▶ **Feature extraction**

# Popular algorithms

## Linear algebra methods

*Matrix factorization methods drawn from the field of linear algebra can be used for dimensionality reduction.*

- ▶ **Principal Components Analysis**
- ▶ Singular Value Decomposition
- ▶ Non-Negative Matrix Factorization
- ▶ Independent Components Analysis

## Manifold Learning Methods

*Manifold learning methods seek a lower-dimensional projection that captures some properties of the input.*

- ▶ Isomap Embedding
- ▶ Locally Linear Embedding
- ▶ Spectral Embedding
- ▶ **t-distributed Stochastic Neighbor Embedding**
- ▶ Uniform Manifold Approximation and Projection

# Principal Components Analysis(PCA)

**Goal:** Find  $r$ -dim projection that best preserves variance

1. Compute mean vector  $\mu$  and covariance matrix  $\Sigma$  of original points
2. Compute eigenvectors and eigenvalues of  $\Sigma$
3. Select top  $r$  eigenvectors
4. Project points onto subspace spanned by them:

$$y = A(x - \mu)$$

where  $y$  is the new point,  $x$  is the old one,  
and the rows of  $A$  are the eigenvectors

# Principal Components Analysis(PCA)

# t-Distributed Stochastic Neighbor Embedding (t-SNE)

High dimensional space

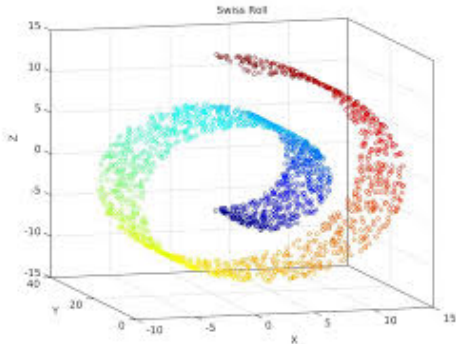

$$p_{ij} = \frac{\exp(-||x_i - x_j||^2 / 2\sigma_i^2)}{\sum_k \sum_{l \neq k} \exp(-||x_k - x_l||^2 / 2\sigma_i^2)}$$

Low dimensional space

$$q_{ij} = \frac{(1 + ||y_i - y_j||^2)^{-1}}{\sum_k \sum_{l \neq k} (1 + ||y_k - y_l||^2)^{-1}}$$

Minimize points

$$KL(P||Q) = \sum_i \sum_{j \neq i} p_{ij} \log \frac{p_{ij}}{q_{ij}}$$

- ▶ Random initialization
- ▶ Gradient descent
- ▶ Preserves local structures
- ▶ Little dependant on tunable parameters

# t-SNE explanations

## Why different distributions in different spaces?

**Crowding problem**  
(Curse of dimensionality)

Student's  $t$ -distribution

## Hyperparameters?

**Perplexity** - the number of neighbors for any point used to compute  $\sigma_i$

- ▶ High perplexity: Takes more global structures into account
- ▶ Low perplexity: Takes more local structures into account

# PCA vs t-SNE

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0  
 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1  
 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2  
 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3  
 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4  
 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5  
 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6  
 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7  
 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8  
 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9

# Dimensionality Reduction before Clustering - MNIST example

## Ground-truth labels

## K-Means

## HDBSCAN

## UMAP + HDBSCAN

# Using Dimensionality Reduction before Clustering

## Points of concerns

- ▶ Does not completely preserve density.
- ▶ Can create false clusters.

→ Do some exploration and evaluation of the clusters that come out to try to validate them if possible.

# Outline

1. Motivations
2. Overview of Clustering Techniques
3. Dimensionality Reduction
- 4. Clustering countries based on early Covid-19 spreading data**
5. Improving further the results from the perspective of clustering

# Features to represent a region

- ▶ All countries from the JHU dataset
- ▶ US states
- ▶ Canadian provinces
- ▶ Chinese provinces
- ▶ Australian states
- ▶ Brazilian states
- ▶ Italian regions

## Objective

Cluster countries/regions together, and use non-Brazil data from the same group to predict Brazilian states epidemic propagation.

## Features used for clustering

**Early Mortality** weekly number of deaths 14 days after the outbreak, divided by the number of confirmed cases, in the week of the outbreak. A two weeks period was used because it is the time required to know the outcome of a contamination.

**Days until 10x** the number of days it takes to multiply the confirmed cases by 10, from the day of the outbreak.

**Early Acceleration** if we denote  $\Delta W_0W_1$  as the percentage increase of confirmed cases from the week of the outbreak to the week after, and  $\Delta W_1W_2$  as the percentage increase from the 1st to the 2nd week after the outbreak, then the early acceleration is defined by:

$$earlyAccel = \frac{\Delta W_1W_2}{\Delta W_0W_1}$$

# Approach

## Dimensionality reduction

### Uniform Manifold Approximation (UMAP) embedding

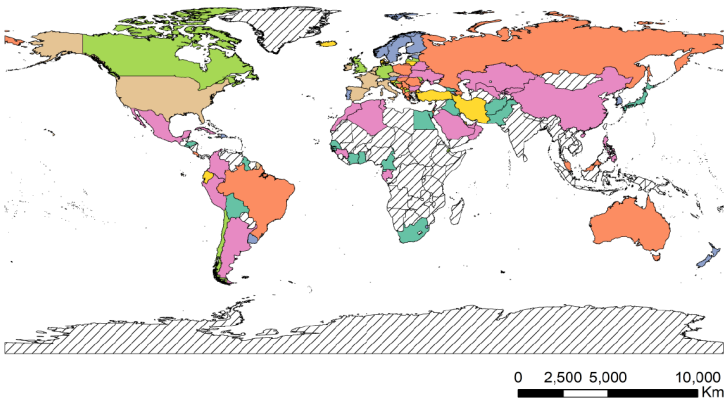

- ▶ Handles well the balance local vs global for keeping distances in the low dimensional embedding
- ▶ Based on studying the topology of the spaces studied
- ▶ Hyperparameters: `min_dist = 0`, `n_neighbors=15`

## Clustering

### Affinity propagation

- ▶ Hyperparameters: `damping=0.8`

# Validation

- ▶ There is no truth!
- ▶ Look if your intuitions are respected to see if clusters make sense.
- ▶ Look if the NN predictions improved after using the clusters for training.

# Code

# Outline

1. Motivations
2. Overview of Clustering Techniques
3. Dimensionality Reduction
4. Clustering countries based on early Covid-19 spreading data
- 5. Improving further the results from the perspective of clustering**

# Strengthen validation approach & Improve current clustering

## Validation approach

Conduct a real numerical study on how much improvements are reach using countries from a cluster vs using all countries.

## Going further

Use this validation to have a numerical feedback on different "dimasionality reduction + clustering" combination and optimize the grouping pipeline.

## Adapt features to refine training regularly

Modify features to be "dynamic":

- ▶ Early Mortality → Current Mortality
- ▶ Days until 10x → Current Speed
- ▶ Early Acceleration → Current Acceleration

And retrain network with updated clusters every day/week/month.

# Grouping Countries and Regions to Improve Covid-19 Dynamics Predictions

*UFRN Covid-19 course Fall 2020*

presented by **Joris Guérin**
